

KEOS

KAAR ENTERPRISE OPERATING SYSTEM

Version 0.1

Knowledge Base & Getting Started Guide

Designed For Kaar tech people

KEOS V1

Knowledge Base & Getting Started Guide

A practical guide to understanding KEOS, creating projects, and working with AI, Skills, Connectors, and enterprise knowledge.

INTERNAL · KAARTECH

Version 1 is primarily designed for KaarTech users to explore agentic conversations, create focused projects, and bring the right AI capabilities and enterprise context together.

1. What Is KEOS

KEOS, the Kaar Enterprise Operating System, brings your data, AI models, agents, and controls together in one system, built on your enterprise core.

Version 1 is built for KaarTech people. It covers the agentic conversational flow: how you talk to KEOS, create projects, and combine AI models, skills, and connectors to reach a goal, 10x faster, on your own or as a team.

Core idea

KEOS is a chat-based way of working, built by KaarTech for KaarTech people. You describe what you want in plain language, and KEOS plans, researches, and acts, using the models, skills, and connectors available in your workspace.

It's grounded in your organization's own systems and data, and it operates inside the access and governance rules your organization has set. Every response stays within the scope, tools, and knowledge it has been given.

Note: KEOS is not a general-purpose chatbot. It's KaarTech's operating layer for AI work, deterministic, governed, and built around your systems, not a replacement for them.

What you can use KEOS for

- ✦ Writing and editing: emails, docs, specs, scripts
- ✦ Coding help: explaining, debugging, generating snippets
- ✦ Research: summarizing documents, extracting insights across systems
- ✦ Brainstorming and planning: ideas, content strategy, prep work
- ✦ Learning: breaking down complex concepts in plain language

Inside a project, KEOS can also produce structured deliverables, project charters, stakeholder emails, or workflow documentation, grounded in the skills, connectors, and knowledge base attached to that project.

Who uses KEOS

KEOS has three levels of access. Each one builds on the level below it.

Role	What they can do
Organization member	Use KEOS for personal research and tasks. View and work within any project they're invited to.
Manager	Everything a member can do, plus: create and configure projects, and invite people to a project. Views Admin & Governance (read-only).

Admin	Everything a Manager can do, plus: create groups, invite people to KEOS, and set budgets for individual users. With organization-wide scope, also allocate and manage budget, and access every project across the organization.
--------------	---

2. Getting Started

Three steps between an invite and your first conversation.

1. Get your invite

An Admin creates your team (a cohort) in KEOS through your organization's SSO, using your work email address. Once you're added, you'll receive an invite by email.

Fig. 01: The KEOS invite email, you've been added to your organization's group.

2. Sign in

Go to keos.kaartech.com. Sign in with your work email and password, or continue with your Microsoft work account.

Fig. 02: Welcome to KEOS, sign in with enterprise SSO or your work email.

3. Land in your conversation space

Once you're signed in, you land directly in the conversation space, ready for your first prompt.

Fig. 03: Your conversation space on first login: "Think It. Ask It. Done."

3. Scope: What KEOS Remembers

Every conversation in KEOS runs within a scope. Scope controls what KEOS can see and remember while it works with you.

Fig. 04: Choosing a scope from the conversation prompt bar.

Fig. 05: Personal, Project, and Organization scopes.

- ✦ **Personal:** stays with you. Only you can see the conversation and its knowledge.
- ✦ **Project:** shared with everyone invited to that project. Teammates can see the conversation and the knowledge behind it.
- ✦ **Organization:** draws on organization-wide knowledge. Visible only to Admins.

You can attach files to any conversation, and switch models depending on your context and scope.

4. Creating and Configuring Projects

A project is a shared workspace: its own skills, connectors, knowledge base, memory, and team, all scoped to one goal.

Create a project

Open the Projects menu from the side navigation. If you haven't created one yet, you'll see an empty state.

Fig. 06: All Projects, no projects created yet.

1. Click New Project, then fill in the project's name and a short description of what you're trying to achieve.

Fig. 07: New Project, Basics tab.

Fig. 08: Basics tab filled in with a project name and description.

2. Move to Resources & Governance and select the skills, connectors, and tools this project needs. You're not locked in, you can add or remove these later from the project's details.

Fig. 09: Resources & Governance, choosing skills, connectors, and tools.

3. Confirm, and your project is ready to use.

Fig. 10: Project created successfully.

Project overview

Every project opens to an overview: members, connectors, skills, and tools attached, at a glance.

Fig. 11: Project overview for a newly created project.

Configure a project and manage roles

From the project overview, open Configure Project to edit the name and description, manage members, or delete the project.

Fig. 12: Configure project, details, members, and danger zone.

Each member you add takes on one of three roles:

- ✦ Project Admin: full control, including deleting the project
- ✦ Project Manager: can manage members and settings
- ✦ Project Member: can work inside the project

Fig. 13: Assigning a member role.

Fig. 14: A project configured with its team in place.

Note: Only a Project Admin can delete a project. Project Managers and Project Members cannot.

Inside a project

Once a project is set up, its details are organized into tabs: Overview, Skills, Connectors, Knowledge Base, Memory, and Tools.

Fig. 15: Project detail tabs.

SKILLS

Browse the skills library, add what your project needs, or upload a custom skill of your own.

Fig. 16: Skills attached to a project.

Fig. 17: Uploading a custom skill.

Fig. 18: Browsing and adding skills from the library.

CONNECTORS

Connect the project to the systems it needs, an internal CRM, an HR system, or any other enterprise source.

Fig. 19: *Browsing available connectors.*

Fig. 20: *Selecting a transport pathway (HTTP recommended).*

Fig. 21: *Configuring a connector, endpoint and credentials.*

KNOWLEDGE BASE

Upload documents as reference material scoped to this project.

Fig. 22: Knowledge base, no documents attached yet.

MEMORY

Once a conversation starts inside the project, KEOS begins saving relevant context automatically, based on your preferences and the tone of the conversation.

TOOLS

Browse and enable the tools this project can call on while it works.

Fig. 23: Tools available to a project.

5. A Worked Example: Drafting a Project Charter

Here's what an agentic conversation inside a project looks like end to end, from a single prompt to a finished, sourced deliverable.

Fig. 24: Starting a new conversation inside the Acme project.

The prompt sets the role and the deliverable, and a reference file is attached directly to the message.

Fig. 25: "Act as a Senior Project Manager. Create a comprehensive project charter for Acme..." with a supporting file attached.

KEOS reasons about the request, loads the DOCX skill, and reaches into the connectors available to the project as it reads the attached file.

Fig. 26: KEOS plans its approach, loading skills and connectors, then reading the attached file.

It grounds the charter in the attached document's actual content, then generates and validates the file before handing it back.

Fig. 27: KEOS generates the charter and validates the output.

Fig. 28: The finished Project Charter opens as an artifact alongside the conversation.

Fig. 29: All ten sections of the charter, with the artifact open for reference.

Both the original source file and the generated charter stay available to open, and KEOS closes with a clear list of what still needs a human decision.

Fig. 30: Source file and generated charter, plus next-step follow-ups.

A follow-up prompt turns the same context into a different deliverable, a stakeholder review email, without starting over.

Fig. 31: The same project context, turned into a stakeholder review email.

Fig. 32: Ready for the next task.

6. Personal Settings

Every KEOS user has a Settings menu, reachable from the account menu in the sidebar.

Fig. 33: Settings, Profile tab, with the account menu open (Settings, Dark mode, Log out).

Personalization

Skills, connectors, knowledge base, memory, and tools, scoped to your personal workspace, the same way they work on a project. Anything you add here applies globally to you, not just to one project.

Fig. 34: Personalization, no personal skills attached yet.

Usage & Allowance

See your monthly spend ceiling, remaining balance, and budget status at a glance.

Fig. 35: Usage & Allowance, spend ceiling, remaining balance, and status.

Dark mode

Switch between light and dark mode any time from the account menu.

**Fig. 36:** KEOS in dark mode.

7. Admin & Governance

Available to Admins (view and edit) and Managers (view only).

Overview

Organization-wide spend, cost by model, active users, and cost per session, filterable by model, with export to CSV.

**Fig. 37:** Admin Overview, spend, cost by model, and usage trend.

Fig. 38: Filtering the overview by model.

User Analytics

Active users, average prompts per user, and per-user cost and activity.

Fig. 39: User Analytics, usage and cost, broken down by user.

Agent Analytics

Usage, cost, and token consumption per agent.

Fig. 40: Agent Analytics, cost and volume per agent.

Budget Governance

Set and manage spend budgets per group.

Fig. 41: Budget Governance, managing budget by group.

8. Global Navigation, Search & Help

The side navigation expands and collapses to fit how you like to work.

Search

Jump anywhere in KEOS from a single command palette, chats, projects, admin & governance, or settings.

Fig. 42: Global search, jump to any area of KEOS.

Help

Help opens the KEOS help desk, where you can raise and track support tickets.

Fig. 43: The KEOS help desk.
